

Problem: Given a nearly sorted array s.t. each of the  $n$  elements can be misplaced by  $\pm 1$ . Positionally search for a target  $t$  if it exists and return index if it does. else return  $-1$ .

Algorithm misBin: Input: an array  $A$ , a target  $t$ , left  $= 1$ , right  $= n$

Output: Index of  $t$  in  $A$  if it exists, else  $-1$ .

Start

if left  $>$  right then  
return  $-1$

fi

$m = \lfloor \frac{\text{left} + \text{right}}{2} \rfloor$

if  $A[m-1] = t$  then  
return  $m-1$

fi

elif  $A[m] = t$  then  
return  $m$

file

elif  $A[m+1] = t$  then  
return  $m+1$

file

elif  $A[m] > t$  then  
return misBin( $A, t, \text{left}, m-1$ )

file

else

return misBin( $A, t, m+1, \text{right}$ )

esle

$T(A): T(n) = T(\frac{n}{2}) + O(1); a=1, b=2, f(n)=O(1); n^a \log n = 1; \text{ as } 1 \in O(1) \text{ where } k=0 \text{ then by Case 2 } T(n) = O(\lg n).$

Hyp: Let  $P(n)$  be the assertion that `misbin` works for all inputs  $\text{right} - \text{left} + 1 = n$ .

Base Case: when  $n=1$   $\text{right} = \text{left} = m$ , if  $A[m] = t$  then  $m$  is returned. If  $A[m] \neq t$  then the else statement happens making  $\text{left} > \text{right}$  and returning  $-1$ . Thus the base case works.

Inductive Step: We assume `misbin` works as long as  $\text{right} - \text{left} + 1 \leq k$  and must prove  $\text{right} - \text{left} + 1 \leq k+1$ . To do this we must prove 6 cases, where  $t$  does not exist in  $A$ ,  $A[m-1] = t$ ,  $A[m] = t$ ,  $A[m+1] = t$ ,  $A[m] > t$  and  $A[m] < t$ .

Case 1:  $t$  does not exist:

As each element in  $A$  is  $\pm 1$  away from or is exactly in the correct position if the array  $A$  is traversed fully and  $t$  is not found at  $A[m-1]$ ,  $A[m]$  or  $A[m+1]$  the else will trip causing  $\text{left} > \text{right}$  returning  $-1$  correctly.

Case 2, 3, 4:  $A[m-1] = t$ ,  $A[m] = t$ ,  $A[m+1] = t$ :

As the function works if ~~misbin~~ is obvious that if any equals  $t$  the index will be returned.

Case 5:  $A[m] > t$ :

We know the array is sorted within  $\pm 1$  of the correct indices. As well  $A[m-1] \neq t$  and  $A[m+1] \neq t$ . Thus if  $t$  exists it must lie to the left of  $m$  between  $A[\text{left}]$  and  $A[m-1]$ . If the recursive call works correctly so shall this call. So  $n = m - 1 - \text{left}$ . when  $\text{right} + \text{left}$  is odd this means  $\frac{\text{left} + \text{right} + 1}{2} - 1 - \text{left} = \frac{\text{left} + \text{right} + 1 - 2\text{left}}{2} - 1 = \frac{\text{right} - \text{left} + 1}{2} - 1$ . when even this means  $\frac{\text{right} + \text{left}}{2} - 1 - \text{left} = \frac{\text{right} + \text{left} - 2\text{left}}{2} - 1 = \frac{\text{right} - \text{left} - 1}{2}$ . both of which are  $\leq \text{right} - \text{left} + 1$  so by transitivity of  $\leq$  ~~right-left+1~~  $\text{right} - \text{left} + 1 \leq k+1 > 0$ . So the recursive call must be between 1 and  $n$  and is correct by Hyp.

Case 6  $A[m] < t$ :

This is symmetrical to case 5. Thus we have  $\text{right} - (m+1) = \text{right} - \frac{\text{right} + \text{left}}{2} + 1$  when  $\text{right} + \text{left}$  is even  $\frac{\text{right} + \text{left} + 1}{2} - 1 - \text{right} = \frac{\text{right} - \text{left} + 1}{2} - 1$ . when odd  $\frac{\text{right} - \text{left}}{2} + 1 - \text{right} = \frac{\text{right} - \text{left} - 1}{2}$ . both of which are  $\leq \text{right} - \text{left} + 1$  so by transitivity of  $\leq$   $\text{right} - \text{left} + 1 \leq k+1 > 0$ . so the recursive call must be in the array and is correct by Hyp.

Q.E.D.  $\therefore$  as the Inductive Step works  $\forall$  cases we can conclude `misbin` is correct  $\square$
